Quadratic Identities and Modularity

Abstract: The work of Andrews, Dyson, and Hickerson (ADH), and of Cohen show that the Fourier coefficients of the function

$$f(q) = 1 + \sum_{n=1}^{\infty} \frac{q^{\frac{n(n+1)}{2}}}{(1+q)(1+q^2)\cdots(1+q^n)};$$

are defined by the arithmetic in $\mathbb{Z}[\sqrt{-6}]$ and can be used to construct a Maass waveform on $\mathfrak{so}(2)$. $f(q)$ is a function studied by Ramanujan.

In this talk, I will discuss the problem of generalizing the results of (ADH) and Cohen. This is joint work, in progress, with Larry Rolin.
